Hi,

The new transaction themes will no longer depend on postMessage API. They will just internally call AJAX api endpoint(s). This is simpler and more future-proof.

As for themes, this is just the beginning, I will allow anyone to publish their themes and extension will allow easy way to install them.

There will be changes how developers will be able to publish their extensions too. Right now, only developers who work on e-invoicing related projects have access.

The Playground is closed. The Architecture is live. 😊🚀

A Parallel View: Australia (Creator) & Bangladesh (Architect)

Hi Lubos,

I see you are busy with the massive evolution of the platform. I had to laugh at the timing—I finalized my own theme engine exactly when you published yours! It seems the logic converged at the same moment.

I’ve processed the new changes. The "Playground" is officially over, and the real architecture has arrived. Looking at the official ****Report Theme** (CHIEF)** and my ****Transaction Theme** (COMMANDER)** side-by-side, they represent a unified vision for the ecosystem:

BUSINESS NAME

REPORT THEME

CHIEF BUILD (AUSTRALIA)

INVOICE

UNIVERSAL BRONZE · INSPIRON

COMMANDER BUILD (BANGLADESH)

Since I survived the Playground and decoded the new architectural DNA, I am requesting ****Developer Portal access**** to begin injecting NBR/FBR compliance logic directly into the ecosystem.

Keep up the brilliant work. The new Manager.io is a masterpiece.
